LaTeX.js Showcase

made with ♥ by Michael Brade

2017–2021

Abstract

This document will show most of the features of LaTeX.js while at the same time being a gentle introduction to LaTeX. In the appendix, the API as well as the format of custom macro definitions in JavaScript will be explained.

1 Characters

It is possible to input any UTF-8 character either directly or by character code using one of the following:

- `\symbol{"00A9}`: ©
- `\char"A9`: ©
- `^^A9 or ^^^^00A9`: © or ©

Special characters, like those:

$ & % # _ { } ~ ^ \

have to be escaped.

More than 200 symbols are accessible through macros. For instance: 30 °C is 86 °F. See also Section ??.

2 Spaces and Comments

Spaces and comments, of course, work just as they do in LaTeX. This is an example: Su- percalifragilisticexpialidocious

It does not matter whether you enter one or several spaces after a word, it will always be typeset as one space—unless you force several spaces, like   now.

New TeXusers may miss whitespaces after a command. Experienced TeXusers are TeXperts, and know how to use whitespaces.

Longer comments can be embedded in the `comment` environment: This is another ex- ample for embedding comments in your document.

3 Dashes and Hyphens

LaTeXknows four kinds of dashes. Access three of them with different numbers of consecu- tive dashes. The fourth sign is actually not a dash at all—it is the mathematical minus sign:

daughter-in-law, X-rated
pages 13–67
yes—or no?
0, 1 and -1

The names for these dashes are: '-' hyphen, '–' en-dash, '—' em-dash, and '$-$' minus sign.
